

Homework assignment#1 (Chap3)

TA Hint: 2020-1103

Due: 2020-1110

(A) Exercises

3.1 Explain why problem formulation must follow goal formulation.

3.5 Consider the n -queens problem using the “efficient” incremental formulation given on page 72. Explain why the state space has at least $\sqrt[3]{n!}$ states and estimate the largest n for which exhaustive exploration is feasible. (*Hint*: Derive a lower bound on the branching factor by considering the maximum number of squares that a queen can attack in any column.)

3.10 Define in your own words the following terms: state, state space, search tree, search node, goal, action, transition model, and branching factor.

3.14 Which of the following are true and which are false? Explain your answers.

- a. Depth-first search always expands at least as many nodes as A* search with an admissible heuristic.
- b. $h(n) = 0$ is an admissible heuristic for the 8-puzzle.
- c. A* is of no use in robotics because percepts, states, and actions are continuous.
- d. Breadth-first search is complete even if zero step costs are allowed.
- e. Assume that a rook can move on a chessboard any number of squares in a straight line, vertically or horizontally, but cannot jump over other pieces. Manhattan distance is an admissible heuristic for the problem of moving the rook from square A to square B in the smallest number of moves.

3.21 Prove each of the following statements, or give a counterexample:

- a. Breadth-first search is a special case of uniform-cost search.
- b. Depth-first search is a special case of best-first tree search.
- c. Uniform-cost search is a special case of A* search.

3.25 The **heuristic path algorithm** (Pohl, 1977) is a best-first search in which the evaluation function is $f(n) = (2 - w)g(n) + wh(n)$. For what values of w is this complete? For what values is it optimal, assuming that h is admissible? What kind of search does this perform for $w = 0$, $w = 1$, and $w = 2$?

3.26 Consider the unbounded version of the regular 2D grid shown in Figure 3.9. The start state is at the origin, $(0,0)$, and the goal state is at (x, y) .

- a. What is the branching factor b in this state space?
- b. How many distinct states are there at depth k (for $k > 0$)?
- c. What is the maximum number of nodes expanded by breadth-first tree search?
- d. What is the maximum number of nodes expanded by breadth-first graph search?
- e. Is $h = |u - x| + |v - y|$ an admissible heuristic for a state at (u, v) ? Explain.
- f. How many nodes are expanded by A^* graph search using h ?
- g. Does h remain admissible if some links are removed?
- h. Does h remain admissible if some links are added between nonadjacent states?

3.29 Prove that if a heuristic is consistent, it must be admissible. Construct an admissible heuristic that is not consistent.

(B) Pseudo codes documentation

Code #1

```
function SIMPLE-PROBLEM-SOLVING-AGENT(percept) returns an action
  persistent: seq, an action sequence, initially empty
               state, some description of the current world state
               goal, a goal, initially null
               problem, a problem formulation

  state  $\leftarrow$  UPDATE-STATE(state, percept)
  if seq is empty then
    goal  $\leftarrow$  FORMULATE-GOAL(state)
    problem  $\leftarrow$  FORMULATE-PROBLEM(state, goal)
    seq  $\leftarrow$  SEARCH(problem)
    if seq = failure then return a null action
  action  $\leftarrow$  FIRST(seq)
  seq  $\leftarrow$  REST(seq)
  return action
```

Code #2

```
function BREADTH-FIRST-SEARCH(problem) returns a solution, or failure

  node  $\leftarrow$  a node with STATE = problem.INITIAL-STATE, PATH-COST = 0
  if problem.GOAL-TEST(node.STATE) then return SOLUTION(node)
  frontier  $\leftarrow$  a FIFO queue with node as the only element
  explored  $\leftarrow$  an empty set
  loop do
    if EMPTY?(frontier) then return failure
    node  $\leftarrow$  POP(frontier) /* chooses the shallowest node in frontier */
    add node.STATE to explored
    for each action in problem.ACTIONS(node.STATE) do
      child  $\leftarrow$  CHILD-NODE(problem, node, action)
      if child.STATE is not in explored or frontier then
        if problem.GOAL-TEST(child.STATE) then return SOLUTION(child)
        frontier  $\leftarrow$  INSERT(child, frontier)
```

Code #3

```
function UNIFORM-COST-SEARCH(problem) returns a solution, or failure
  node  $\leftarrow$  a node with STATE = problem.INITIAL-STATE, PATH-COST = 0
  frontier  $\leftarrow$  a priority queue ordered by PATH-COST, with node as the only element
  explored  $\leftarrow$  an empty set
  loop do
    if EMPTY?(frontier) then return failure
    node  $\leftarrow$  POP(frontier) /* chooses the lowest-cost node in frontier */
    if problem.GOAL-TEST(node.STATE) then return SOLUTION(node)
    add node.STATE to explored
    for each action in problem.ACTIONS(node.STATE) do
      child  $\leftarrow$  CHILD-NODE(problem, node, action)
      if child.STATE is not in explored or frontier then
        frontier  $\leftarrow$  INSERT(child, frontier)
      else if child.STATE is in frontier with higher PATH-COST then
        replace that frontier node with child
```

Code #4

```
function DEPTH-LIMITED-SEARCH(problem, limit) returns soln/fail/cutoff
  RECURSIVE-DLS(MAKE-NODE(INITIAL-STATE[problem]), problem, limit)
function RECURSIVE-DLS(node, problem, limit) returns soln/fail/cutoff
  cutoff-occurred?  $\leftarrow$  false
  if GOAL-TEST[problem](STATE[node]) then return SOLUTION(node)
  else if DEPTH[node] = limit then return cutoff
  else for each successor in EXPAND(node, problem) do
    result  $\leftarrow$  RECURSIVE-DLS(successor, problem, limit)
    if result = cutoff then cutoff-occurred?  $\leftarrow$  true
    else if result  $\neq$  failure then return result
  if cutoff-occurred? then return cutoff else return failure
```

```
function ITERATIVE-DEEPENING-SEARCH(problem) returns a solution, or failure
  inputs: problem, a problem
  for depth  $\leftarrow$  0 to  $\infty$  do
    result  $\leftarrow$  DEPTH-LIMITED-SEARCH(problem, depth)
    if result  $\neq$  cutoff then return result
```

Code #5

```
function DEPTH-LIMITED-SEARCH(problem, limit) returns a solution, or failure/cutoff  
  return RECURSIVE-DLS(MAKE-NODE(problem.INITIAL-STATE), problem, limit)  
  
function RECURSIVE-DLS(node, problem, limit) returns a solution, or failure/cutoff  
  if problem.GOAL-TEST(node.STATE) then return SOLUTION(node)  
  else if limit = 0 then return cutoff  
  else  
    cutoff_occurred?  $\leftarrow$  false  
    for each action in problem.ACTIONS(node.STATE) do  
      child  $\leftarrow$  CHILD-NODE(problem, node, action)  
      result  $\leftarrow$  RECURSIVE-DLS(child, problem, limit - 1)  
      if result = cutoff then cutoff_occurred?  $\leftarrow$  true  
      else if result  $\neq$  failure then return result  
    if cutoff_occurred? then return cutoff else return failure
```

Code #6

```
function RECURSIVE-BEST-FIRST-SEARCH(problem) returns a solution, or failure  
  return RBFS(problem, MAKE-NODE(problem.INITIAL-STATE),  $\infty$ )  
  
function RBFS(problem, node, f_limit) returns a solution, or failure and a new f-cost limit  
  if problem.GOAL-TEST(node.STATE) then return SOLUTION(node)  
  successors  $\leftarrow$  []  
  for each action in problem.ACTIONS(node.STATE) do  
    add CHILD-NODE(problem, node, action) into successors  
  if successors is empty then return failure,  $\infty$   
  for each s in successors do /* update f with value from previous search, if any */  
    s.f  $\leftarrow$  max(s.g + s.h, node.f)  
  loop do  
    best  $\leftarrow$  the lowest f-value node in successors  
    if best.f > f_limit then return failure, best.f  
    alternative  $\leftarrow$  the second-lowest f-value among successors  
    result, best.f  $\leftarrow$  RBFS(problem, best, min(f_limit, alternative))  
    if result  $\neq$  failure then return result
```

Code #7

```
function SMA*(problem) returns a solution sequence
inputs: problem, a problem
static: Queue, a queue of nodes ordered by f-cost

Queue  $\leftarrow$  MAKE-QUEUE({MAKE-NODE(INITIAL-STATE[problem]))})
loop do
  if Queue is empty then return failure
  n  $\leftarrow$  deepest least-f-cost node in Queue
  if GOAL-TEST(n) then return success
  s  $\leftarrow$  NEXT-SUCCESSOR(n)
  if s is not a goal and is at maximum depth then
    f(s)  $\leftarrow$   $\infty$ 
  else
    f(s)  $\leftarrow$  MAX(f(n),g(s)+h(s))
  if all of n's successors have been generated then
    update n's f-cost and those of its ancestors if necessary
  if SUCCESSORS(n) all in memory then remove n from Queue
  if memory is full then
    delete shallowest, highest-f-cost node in Queue
    remove it from its parent's successor list
    insert its parent on Queue if necessary
  insert s in Queue
end
```
